Connect the RS-232C to RJ45 cable to the rear panel port: RJ45 female connector.

Terminal application

Invoke a terminal application such as MTTTY (Multi-Threaded TTY).

- For RS-232C, set the COM port, baud rate, stop bit, data bit, and parity accordingly.

To check the COM port No. for RS-232C, see the Device Manager in the PC. For Win XP, Control panel → System → Hardware tab.

5. Ensure the terminal application has the following settings;
6. Baud rate – as per PEL-2000B settings
7. Com Port – as per PC settings (Device Manager)
8. Parity – None
9. Data bits – 8
10. Stop bits – None

Functionality check

Run this query command via the terminal.

COMMAND OVERVIEW

The Command overview chapter lists all the PEL-2000B commands and command queries .The command syntax section shows you the basic rules you have to apply when using commands.

Command Syntax	16
List of Commands in Functional Order.....	19

Command Syntax

Compatible standard	<ul style="list-style-type: none">• IEEE488.2, 1992 (fully compatible)• SCPI, 1994 (partially compatible)
Command types	There are a number of different instrument commands and queries. A command sends instructions or data to the electronic load and a query receives data or status information from the electronic load.
<hr/>	
Simple	A single command with/without a parameter
Example	*OPC
Compound	Two or more commands separated by a colon (:) with/without a parameter
Example	UTILITY:SOUND 1
Query	A query is a simple or compound command followed by a question mark (?). A parameter (data) is returned.
Example	UTILITY:SOUND?
Command forms	Commands and queries have two different forms, long and short. The command syntax is written with the short form of the command in capitals and the remainder (long form) in lower case.

The commands can be written in capitals or lower-case, just so long as the short or long forms

are complete. An incomplete command will not be recognized.

Below are examples of correctly written commands.

LONG	FETCh:VOLTage?	FETCH:VOTAGE?
	fetch:voltage?	

SHORT	FETC:VOLT?	fetc:volt?
-------	------------	------------

Square Brackets	Commands that contain squares brackets indicate that the contents are optional. The function of the command is the same with or without the square bracketed items, as shown below.
-----------------	---

Example:

:LOAD[:STATe]

= :LOAD:STATe

= :LOAD

Command format	:PROGraM:CHAin <NR1>LF 1: command header			
	1	2	3	4
	2: single space			
	3: parameter			
	4: message terminator			

Parameter	Type	Description	Example
	<Boolean>	Boolean logic	0, 1
	<NR1>	integers	0, 1, 2, 3
	<NR2>	decimal numbers	0.1, 3.14, 8.5
	<NR3>	floating point	4.5e-1, 8.25e+1
	<NRf>	any of NR1, 2, 3	1, 1.5, 4.5e-1
	<NRf+>	NRf type including MIN (minimum) and MAX (maximum) limits of the parameter.	1, 1.5, 4.5e-1 MAX, MIN

<aard>	Arbitrary ascii characters.
<block data>	IEEE-488.2 binary block data. The block data is comprised of five parts:  a. Initialization character (#) b. Digit length (in ASCII) of the number of bytes c. Number of bytes d. Binary data e. New line character
Message terminator	LF^END line feed code (hexadecimal 0A) with END message LF line feed code
<dab>^END	last data byte with END message
 Note	In case of setting the parameter which is less than setting resolution, the setting value will round down to a smaller value which closed to the setting value.
 Note	The receiving buffer size of this unit is 40k Bytes. Do not send the IEEE-488.2 binary block data to this unit at once data transformation. It may cause an unexpected error.

	See page 177 for details.	
Syntax	*CLS	
Example	*CLS	

***ESE** Status Command

Description The Standard Event Status Enable command determines which events in the Standard Event Status Event register can set the Event Summary Bit (ESB) of the Status Byte register. Any bit positions set to 1 enable the corresponding event. Any enabled events set bit 5 (ESB) of the Status Byte register. See page 185 for details.

Syntax *ESE <NRF>

Parameter	<NRF>	Bit(s) Set	<NRF>	Bit(s) Set
	1	OPC	32	CME
	8	DDE	64	~
	16	EXE	128	~

Example *ESE 40 Sets CME and DDE events in the Standard Event Status Event Register.

Query Syntax *ESE?

Return Parameter	<NR1>	Bit(s) Set	<NR1>	Bit(s) Set
	1	OPC	32	CME
QYE	8	DDE	64	~
	16	EXE	128	~

Example *ESE?
32 Returns the settings in the Standard Event Status Enable Register. Here CME is enabled.

***ESR?** Status Command

Description Reads the Standard Event Status Register. This command also clears the Standard Event Status Register. Page 184 for details.

Query Syntax	*ESR?			
Return Parameter	<NR1>	Bit(s) Set	<NR1>	Bit(s) Set
	1	OPC	32	CME
	8	DDE	64	~
	16	EXE	128	~

Example	*ESR? 48	The return value is the status reading of the standard Event Status Register.
---------	-------------	---

*IDN? System Command

Description Returns the load generator identification.

Query Syntax	*IDN?			
Return Parameter	<aard>	Data	<aard>	Data
	GW	Manufacturer	00000001	Serial No.
	PEL-2004A	Model	V3.01	Firmware Version

Example	*IDN? GW, PEL-2002B/2004B, 00000001, V3.01	Returns the mainframe identification string.
---------	--	--

*OPC Status Command

Description This command sets the OPC (Operation Command Bit) bit (bit 0) of the Standard Event Status Register after the mainframe has completed all pending operations. See page 184 for details.

Syntax	*OPC		
--------	------	--	--

Example	*OPC	Sets the OPC bit.
---------	------	-------------------

Query Syntax	*OPC?		
--------------	-------	--	--

Return Parameter	<NR1>	Operation	<NR1>	Operation
------------------	-------	-----------	-------	-----------

	0	Pending	1	Complete			
Query Example	*OPC?	All pending operations are completed.					
	1

The PEL-2040B and PEL-2041B are fully support group mode(Para/Sync)

The PEL-2030B does not support group function.

The dual channel of PEL-2020B does support group function partially. It can support to group 2 units under the Sync mode only. That means the PEL-2020A can be 2chx100W or 1chx200W.

Query Example	:CONF:GRO:MODE? 0	The parallel mode is currently set to SYNC.
---------------	----------------------	---

**Note**

The para setting allows the all the parallelized load modules to be operated as a single large load module.

Sync mode allows the settings of a single unit to be synchronized across all the other parallelized load modules.

The major difference is that the Para mode calculates the total amount of current on the screen of the Mainframe, and the Sync mode does not.

The PEL-2040B and PEL-2041B are fully support group mode (Para/Sync). The PEL-2030B does not support group function.

The dual channel of PEL-2020B does support group function partially. It can support to group 2 units under the Sync mode only. That means the PEL-2020A can be 2chx100W or 1chx200W.

S TATUS REGISTERS

To program the PEL-2000B series effectively, the Status Register structure needs to be understood. This chapter explains in detail the structure of the status registers.

Status Register Overview

Description	<p>The status registers are used to determine the status of the electronic load. The status registers maintain the status of the protection conditions, load conditions and channel conditions of the load modules.</p> <p>The PEL-2000B series have a number of register groups:</p> <ul style="list-style-type: none">Channel Status Registers (one for each channel)Channel Summary RegistersQuestionable Status RegistersStandard Event Status RegistersStatus Byte RegisterService Request Generation Register <p>The structure of the status registers is shown on the next page.</p>

Channel Status

Description Each channel has a dedicated Channel Status Register group. These registers show if any errors or faults have occurred to a specific channel. The Channel Status Register group consists of: the Condition, EVENT and ENABLE registers as well as PTR/NTR (positive and negative transition) filters.

Channel Status Registers

Bit Position	7-15	6	5	4	3	2	1	0
Condition	0	UVP	G/N	OT	RV	OP	OV	OC
PTR/NTR	0	UVP	G/N	OT	RV	OP	OV	OC
EVENT	0	UVP	G/N	OT	RV	OP	OV	OC
ENABLE	0	UVP	G/N	OT	RV	OP	OV	OC
Bit weight		64	32	16	8	4	2	1

Protection Bits

OC	If an over current condition occurs the OC bit (bit 0) is set. The OC bit can be cleared only with the :LOAD:PROtection:CLEar command if the over current condition is invalid.
OV	If an over voltage condition occurs, the OV bit (bit 1) will be set. The OV bit can be cleared only with the :LOAD:PROtection:CLEar command if the over voltage condition is invalid.
OP	If an over power condition occurs, the OP bit (bit 2) is set. The OP bit can be cleared only with the :LOAD:PROtection:CLEar command if the over power condition is invalid.

RV	If a reverse voltage condition occurs the RV bit (bit 3) is set. The RV bit is automatically cleared after the reverse voltage is removed.
OT	When the internal temperature exceeds 85°C the OT bit will be set. The OT bit is automatically cleared after the temperature goes below 85°C.
G/N	The Go/NoGo bit is set when Go/NoGo limits have been exceeded, when Go/NoGo SPEC has been enabled.
UVP	If the under voltage condition occurs the UVP bit is set.
Condition Register	The condition register indicates the status of the electronic load. The condition register can only be changed by a change in the condition of the electronic load. Reading the condition register does not change the state of the condition register.
PTR/NTR Register	The PTR/NTR (Positive/Negative transition) register determines the type of transition conditions that will trigger an event. Only the Channel Status Register and Questionable Status Register can be transition programmed.
	Positive Transition 0→1
	Negative Transition 1→0
Event Register	The Event Register indicates if an event has been triggered according to the transition settings from the PTR/NTR Register.
Enable Register	The Enable register determines which status event(s) are enabled. Any status events (OC, OV, OP, RV, OT, G/N, UVP) that are enabled will set the corresponding channel bit in the Channel Summary Event Register.

Channel Summary

Description The Channel Summary Registers consolidate the channel status of all 4/8 channels, depending on the electronic load.

Channel Summary Registers								
Bit Position	7	6	5	4	3	2	1	0
EVENT	CH8	CH7	CH6	CH5	CH4	CH3	CH2	CH1

Event Register If an event has been enabled and set in the Channel Status Registers, then the corresponding channel bit will be set in the Channel Summary Event Register. If the Event Register is read, it will be cleared to 0.

Enable Register The Enable Register is used to determine which channel events will be used to set the CSUM bit of the Status Byte Register.

Questionable Status

Description The Questionable Status Registers will show if any faults or errors have occurred. The Questionable Status Registers have the same events as the Channel Status Registers.

Questionable Status Register								
Bit Position	7-15	6	5	4	3	2	1	0
Condition	0	UVP	G/N	OT	RV	OP	OV	OC
PTR/NTR	0	UVP	G/N	OT	RV	OP	OV	OC
EVENT	0	UVP	G/N	OT	RV	OP	OV	OC
ENABLE	0	UVP	G/N	OT	RV	OP	OV	OC
Bit weight		64	32	16	8	4	2	1

Bit Summary	OC	Over Current
	OV	Over voltage
	OP	Over Power
	RV	Reverse Voltage
	OT	Over Temperature
	G/N	Go/NoGo
	UVP	Under Voltage Protection
Condition Register	The Questionable Status Condition Register indicates the status of the electronic load. If a bit is set in the Condition register (OC, OV, OP, RV) indicates that the event is true. Reading the condition register does not change the state of the condition register.	
PTR/NTR Register	The PTR/NTR (Positive/Negative transition) register determines the type of transition conditions will set the corresponding bit in the Event Registers. Only the Channel Status Register and Questionable Status Register can be transition programmed.	
	Positive Transition	$0 \rightarrow 1$
	Negative Transition	$1 \rightarrow 0$
Event Register	The PTR/NTR Register will dictate the type of transition conditions will set the corresponding bits in the Event Register. If the Event Register is read, it will be cleared to 0.	
Enable Register	The Enable Register is used to determine which channel events will be used to set the QUES bit of the Status Byte Register.	

Output Queue

Description The Output queue stores output messages in a FIFO buffer until read. If the Output Queue has data, the MAV bit in the Status Byte Register is set.

Standard Event Status

Description The Standard Event Status Registers indicate any programming errors that occur. The Standard Event Status Register group comprises of the Event and Enable registers.

Standard Event Status Registers								
Bit Position	7	6	5	4	3	2	1	0
EVENT	0	0	CME	EXE	DDE	QUE	0	OPC
ENABLE	0	0	CME	EXE	DDE	QUE	0	OPC
Bit weight	128	64	32	16	8	4	2	1

Error Bits	OPC	The operation complete bit is set when all selected pending operations are complete. This bit is set in response to the *OPC command.
	QUE	The query error bit is set when there is an error reading the output queue. This can be caused by trying to read the output queue when there is no data in it.
	DDE	The Device Dependent Error indicates a memory error/lost memory or failure of the self-test.
	EXE	The Execution bit indicates an execution error due to one of the following

- Illegal command parameter
- Parameter out of range
- Invalid parameter

Command didn't execute due to an overriding operation condition.

CME	The Command Error bit is set when a syntax error has occurred. The CME bit can also be set when a <GET> command is received within a program message. (Group Execute Trigger) as defined in IEEE 488.1.
-----	---

Event Register	The Event Register will be set to 0 when read.
----------------	--

Enable Register	The Enable Register determines which events will set the ESB Bit (bit 5) in the Status Byte Register.
-----------------	---

Status Byte Register

Description	The Status Byte register consolidates the status events of all the status registers. The Status Byte register can be read with the *STB? query or a serial poll and can be cleared with the *CLS command.
-------------	---

Status Byte Register								
Bit Position	7	6	5	4	3	2	1	0
Condition	0	MSS	ESB	MAV	QUES	CSUM	ERR	0
Bit weight	128	64	32	16	8	4	2	1

Status Bits	CSUM	The CSUM bit is set when an Enabled event has occurred on a channel. The Channel Condition, Channel Event and Channel Summary Event Registers all determine if the CSUM bit is set.
-------------	------	---

QUES	The Questionable bit is set when a questionable event has occurred.
------	---

ESB	The Event Status bit is set if an enabled event in the Standard Event Status Event Register has occurred.
ERR	The ERR bit is set when there is a message in the error queue.
MSS & RQS	The Master Summary Status is used with the *STB? query. When the *STB? query is read the MSS bit is not cleared. The Request Service bit is cleared when it is polled during a serial poll.

Service Request Register

Description	The Service Request Generation Register determines which events in the Status Byte Register will generate Service Requests. It is essentially the Status Byte Enable Register. The bit events are the same as the Status Byte Register, minus the MSS/RQS bit.
